

ABSTRACT

The present disclosure describes prefabricated, modular plumbing assemblies and methods of installing the plumbing assemblies. The plumbing assemblies contain all the components needed for a complete installation. The plumbing assemblies are modular and prefabricated, so that in most cases only one measurement is required on site for installation of the assemblies. The installed plumbing assemblies are at an appropriate finished height and orientation for connection to a plumbing fixture. The use of the plumbing assemblies of the present disclosure greatly simplifies the installation process, decreasing the labor cost associated with installation, decreasing the time needed for installation, saving on material costs and material waste and reducing the installation errors inherent in the current methods for installing plumbing assemblies.
